

# CUSTOMERS GIVE BIG TICK FOR SWEEPCART

According to experts, supermarket trolleys are one of the most contaminated surfaces for bacteria and disease. The COVID-19 pandemic has heightened consumer awareness around health and sanitation. This trend will continue post-pandemic with customers choosing to shop where they feel safe and looked after.

**D**esigned with supermarket and airport trolleys in mind, Sweepcart simulates a photocatalytic process that kills 99.99 percent of bacteria, viruses, and a wide range of pathogens.

Unlike other sanitisation methods that employ harsh disinfectants, alcohols, detergents, ozone or steam, the patented coating on Sweepcart acts as a megaphone for five UV-A lights. It is creating an environment within the machine that effectively penetrates the membrane of the Covid-19 virus and destroys each cell.

In addition to germs and Covid-19, a single 20-second cycle will remove bad odours, bacteria, moulds, and pollution. Reactive Oxygen Species (ROS) convert hazardous organic substances into harmless inorganic molecules (H<sub>2</sub>O and CO<sub>2</sub>).

Sweepcart is super easy to use; customers push a trolley into the unit, where it automatically starts, indicated by a blue light. Each cycle takes just 20 seconds, enough time to sanitise your hands at the sanitiser station. Once the light turns green,

your trolley is clean and ready to use.

Sweepcart sanitises the whole trolley – handle, basket, and wheels.

From current installations, customers have given positive feedback on Sweepcart's ease of use and the lack of harmful chemicals.

"It's great that the product aligns with our environmental goals, using a natural process rather than detergents," noted one store owner.

Unlike using detergents and sanitisation products that can eventually do damage, the sanitising process of Sweepcart prevents the deterioration of chrome, plastic, or painted surfaces.

But it's not just trolleys; Sweepcart has proven effectiveness in sanitising any goods in trolleys and baskets. It also has other applications in different sectors, including healthcare, where wheelchairs can be sanitised between users in hospitals. Sweepcart units are coated with WiWell technology on the exterior, sanitising the surrounding environment. One unit provides the equivalent benefit

of five tall trees.

Sweepcart is best installed inside, preferably at the entrance. The unit can sanitise its environment and is easy to use by customers as they select a trolley on entering the store. Customers may also choose to sanitise their purchases on departure, or customers' purchases can be sanitised before click and collect or delivery.

There is also no need to worry about children crawling into the Sweepcart as motion and heat sensors prevent Sweepcart from operating while living intrusions are present.

The life of Sweepcart's internal lamps is 5,000 hours of effective use, which is about five years in a supermarket. Plus, every Sweepcart is sold with a one-year manufacturer's guarantee.
